## Life cycle of a plant

Read the information provided below and fill in the boxes with relevant information about the various stages of a plant's life cycle.

## Plant life cycle:

At maturity, a plant produces flowers which later on develop into seeds. Mature seeds are sometimes dispersed by animals or wind. If they fall on fertile and moist soil, they develop a cotyledon which further germinates into a seedling. Seedlings grow up into a mature plant that in turn produces flowers, fruits and seeds. This process is represented diagramatically as a plant life cycle.
